[https://drive.google.com/open?id=0B-ob6L\\_OjGLpfnV3MVI6X3pXOWw1Z3YtQUUpJRVRiTknkbGNFbVBNRXhjSkw3bWk1WHdYcW8](https://drive.google.com/open?id=0B-ob6L_OjGLpfnV3MVI6X3pXOWw1Z3YtQUUpJRVRiTknkbGNFbVBNRXhjSkw3bWk1WHdYcW8) NEW QUESTION 400 You are planning to create a virtual network that has a scale set that contains six virtual machines (VMs).

A monitoring solution on a different network will need access to the VMs inside the scale set. You need to define public access to the VMs. Solution: Use Remote Desktop Protocol (RDP) to connect to the VM in the scale set. Does the solution meet the goal? A. Yes B. No Answer: B Explanation: Public IP addresses are necessary because they provide the load balanced entry point for the virtual machines in the scale set. The public IP address will route traffic to the appropriate virtual machines in the scale set.

<https://mitra.computa.asia/articles/msdn-virtual-machine-scale-sets-it-really-about-protecting-your-applications-performance> NEW

QUESTION 401 Your company has deployed several virtual machines (VMs) on-premises and to Azure. Azure Express Route has been deployed and configured for on-premises to Azure connectivity. Several VMs are exhibiting network connectivity issues. You need to analyze the network traffic to determine whether packets are being allowed or denied to the VMs. Solution: Use Azure Network Watcher to run IP flow verify to analyze the network traffic. Does the solution meet the goal? A. Yes B. No Answer: B Explanation: You need to analyze the data at a higher level. Note: You can install and configure the Operations Management Suite (OMS) and Dependency Agents on all VMs. Use the Wire Data solution in Azure Log Analytics to analyze the network traffic.

<https://docs.microsoft.com/en-us/azure/log-analytics/log-analytics-wire-data> NEW QUESTION 402

You are migrating an on-premises application to Azure. One component of the application is a legacy Windows native executable that performs image processing. The image processing application must run every hour. During times that the image processing application is not running, it should not be consuming any Azure compute resources. You need to ensure that the image processing application runs correctly every hour. Solution: Create an Azure Function to run the image processing application every hour. Does the solution meet the goal? A. Yes B. No Answer: B Explanation: It is better to run the legacy application in a VM.

NEW QUESTION 403 Your company uses Azure Active Directory (Azure AD) to secure several Azure App Service Web and API applications. The applications are used by company employees and allow single sign-on (SSO). The applications must allow external users to sign-in. The external users must be managed the same way as employees and allow the external users to be added to the same employee user groups. You need to enable the external user sign-in. What should you do? A. Install and configure an Azure AD Connect server to use password hash synchronization and select the "Enable single sign on" option. B. Install and configure an Azure AD Connect server to use pass-through authentication and select the "Enable single sign-on" option. C. Enable and configure Azure AD business-to-consumer (B2C) Multi-Factor Authentication. D. Enable and configure Azure AD business-to-business (B2B) collaboration. Answer: C Explanation: Azure AD B2C supports single sign-on. Azure Active Directory (Azure AD) B2C integrates directly with Azure Multi-Factor Authentication so that you can add a second layer of security to sign-up and sign-in experiences in your consumer-facing applications.

<https://docs.microsoft.com/en-us/azure/active-directory-b2c/active-directory-b2c-reference-mfa> NEW QUESTION 404

A company runs virtual machines (VMs) in Azure. Some VMs are hosted in a virtual network in the West Central US region. Other VMs are hosted in a virtual network in the West US 2 region. Each virtual network has its own IP address range. The virtual networks are not integrated. You need to ensure that databases in the virtual networks can replicate data from one region to the other. The solution must minimize effort required. Which two actions should you recommend? (Each correct answer presents part of the solution. Choose two.) A. Implement virtual network peering. B. Migrate the database to Azure SQL Database. C. Create ExpressRoute connections to each virtual network. D. Configure database replication for the databases.

Answer: B D Explanation: Active geo-replication is Azure SQL Database feature that allows you to create readable replicas of your database in the same or different data center (region).

<https://docs.microsoft.com/en-us/azure/sql-database/sql-database-geo-replication-overview> NEW QUESTION 405

You are designing a live streaming event by using Azure Media Services. The delivery of the video will use HTTP Live Streaming (HLS) to an Azure Content Delivery Network (CDN) streaming endpoint. Viewers of the content may not be a trusted party and you require

the highest level of security. You must secure the media delivery by using dynamic encryption. Solution: Use AES-128 dynamic encryption and the key delivery service to encrypt all assets with an associated encryption key and authorization policy. Configure the asset's delivery policy to deliver by using Advanced Encryption Standard (AES). Does the solution meet the goal? A. Yes B. No Answer: A Explanation: You can use Azure Media Services to secure your media from the time it leaves your computer through storage, processing, and delivery. With Media Services, you can deliver your live and on-demand content encrypted dynamically with Advanced Encryption Standard (AES-128) or any of the three major digital rights management (DRM) systems: Microsoft PlayReady, Google Widevine, and Apple FairPlay.

<https://docs.microsoft.com/en-us/azure/media-services/previous/media-services-content-protection-overview> NEW QUESTION 406

A company has 100 Web servers running Windows Server on virtual machines (VMs) in Azure. All servers have IIS enabled. Each server runs a unique combination of web apps. Servers must not run unnecessary services. The servers must be checked every 30 minutes to remove any additional Windows features and correct exceptions. You need to design the solution with the least amount of effort and without downtime. Solution: Design a solution based on VM scale sets. Does the solution meet the goal? A. Yes B. No

Answer: B Explanation: Instead use Azure Automation State Configuration. NEW QUESTION 407 A company has 100 Web servers running Windows Server on virtual machines (VMs) in Azure. All servers have IIS enabled. Each server runs a unique combination of web apps. Servers must not run unnecessary services. The servers must be checked every 30 minutes to remove any additional Windows features and correct exceptions. You need to design the solution with the least amount of effort and without downtime.

Solution: Design a solution that deploys a unique Azure Resource Manager template for each VM and copy the appropriate web apps. Create the required number of VMs. Does the solution meet the goal? A. Yes B. No Answer: B Explanation: Instead use Azure Automation State Configuration. Note: With Resource Manager, you can create a template (in JSON format) that defines the infrastructure and configuration of your Azure solution. By using a template, you can repeatedly deploy your solution throughout its lifecycle and have confidence your resources are deployed in a consistent state. When you create a solution from the portal, the solution automatically includes a deployment template. You don't have to create your template from scratch because you can start with the template for your solution and customize it to meet your specific needs.

<https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-overview> NEW QUESTION 408

A company has 100 Web servers running Windows Server on virtual machines (VMs) in Azure. All servers have IIS enabled. Each server runs a unique combination of web apps. Servers must not run unnecessary services. The servers must be checked every 30 minutes to remove any additional Windows features and correct exceptions. You need to design the solution with the least amount of effort and without downtime. Solution: Use Azure Automation DSC. Does the solution meet the goal? A. Yes B. No Answer: A Explanation: Azure Automation State Configuration is an Azure service that allows you to write, manage, and compile PowerShell Desired State Configuration (DSC) configurations, import DSC Resources, and assign configurations to target nodes, all in the cloud.

<https://docs.microsoft.com/en-us/azure/automation/automation-dsc-overview> NEW QUESTION 409 Your company is developing an e-commerce Azure App Service Web App to support hundreds of restaurant locations around the world. You are designing the messaging solution architecture to support the e-commerce transactions and messages. The e-commerce application has the following features and requirements:

Feature	Requirement
Shopping Cart	<ul style="list-style-type: none"><li>Items in a shopping cart must be processed by an Azure Function within a specified number of minutes. Failure to process should move the items to a failed state for processing by a separate Azure Function.</li><li>Shopping cart transactions must not be lost and fault conditions must be processed separately.</li><li>Shopping cart transactions must be read by the inventory and sales systems for further processing.</li></ul>
Inventory Distribution	<ul style="list-style-type: none"><li>Items sent to the inventory system must run a separate workflow for each item that includes warehouse, shipping, and order processing updates</li><li>Inventory uses Azure Blob storage to store inventory items and related information.</li><li>Inventory is processed by using an Azure Logic App.</li></ul>
Restaurant Telemetry	<ul style="list-style-type: none"><li>Restaurants stream millions of daily events from all locations.</li><li>Restaurant data should be captured in Azure Blob storage for conditional processing.</li><li>Restaurant event data should expire after 24 hours.</li></ul>

You need to design a solution for the Inventory Distribution feature. Which Azure service should you use? A. Azure Event Hub B.

Azure Service BusC. Azure Event GridD. Azure Relay Answer: BExplanation:Service Bus is intended for traditional enterprise applications. These enterprise applications require transactions, ordering, duplicate detection, and instantaneous consistency. Service Bus enables cloud-native applications to provide reliable state transition management for business processes. Incorrect:Not A: Azure Event Hubs is a big data pipeline. It facilitates the capture, retention, and replay of telemetry and event stream data.Not C: Event Grid is an eventing backplane that enables event-driven, reactive programming.Not D: The Azure Relay service enables you to securely expose services that run in your corporate network to the public cloud.

<https://docs.microsoft.com/en-us/azure/event-grid/compare-messaging-services> NEW QUESTION 410A company uses Microsoft Operations Management Suite (OMS) to manage 1,000 virtual machines (VMs) in Azure. The security officer reports that VMs often are not updated. You recommend to the company that they implement the OMS Update Management solution. You need to describe the OMS Update Management solution to the company. Which functionality does the OMS Update Management solution provide? A. assessment of Windows and Linux updates on the VMsB. alerts regarding VM issuesC. overview of network activity on the VMsD. deployment of required updates to VMs Answer: AExplanation:The Update Management solution in Azure automation allows you to manage operating system updates for your Windows and Linux computers deployed in Azure, on-premises environments, or other cloud providers. You can quickly assess the status of available updates on all agent computers and manage the process of installing required updates for servers. Note: After updates are assessed for all the Linux and Windows computers in your workspace, you can install required updates by creating an update deployment. An update deployment is a scheduled installation of required updates for one or more computers.

<https://docs.microsoft.com/en-us/azure/operations-management-suite/oms-solution-update-management> NEW QUESTION 411You manage an application instance. The application consumes data from multiple databases. Application code references database tables using a combination of the server, database, and table name. You need to migrate the application instance to Azure. What are two possible ways to achieve this goal? (Each correct answer presents a complete solution. Choose two.) A. SQL Server Stretch DatabaseB. SQL Server in an Azure virtual machineC. SQL Managed InstanceD. Azure SQL Database Answer: AC Explanation:A: SQL Server Stretch Database lets you dynamically stretch warm and cold transactional data from Microsoft SQL Server 2016 to Microsoft Azure. Access SQL Server data if it's on-premises or stretched to the cloud. You set policy that determines where data is stored and SQL Server moves the data in the background for you. The table is online and ready to query, and you don't have to change existing queries or applications--it's completely transparent.C: Managed Instance allows existing SQL Server customers to lift and shift their on-premises applications to the cloud with minimal application and database changes. At the same time, Managed Instance preserves all PaaS capabilities (automatic patching and version updates, automated backups, high-availability), that drastically reduces management overhead and TCO.

<https://azure.microsoft.com/en-us/services/sql-server-stretch-database/>

<https://docs.microsoft.com/en-us/azure/sql-database/sql-database-managed-instance> NEW QUESTION 412You are designing a security solution for a company's web application. You need to secure the web application by using Web Application Firewall (WAF). For which three types of attacks will the solution protect? (Each correct answer presents part of the solution. Choose three.)

A. zero-day exploitsB. SQL injectionC. DOS attacksD. cross-site scripting attacksE. DDOS attacks Answer: BCD Explanation:Web Application Firewall features include:- SQL injection protection- Cross site scripting protection- Common Web Attacks Protection such as command injection, HTTP request smuggling, HTTP response splitting, and remote file inclusion attack- Protection against HTTP protocol violations- Protection against HTTP protocol anomalies such as missing host user-agent and accept headers- Prevention against bots, crawlers, and scanners- Detection of common application misconfigurations (that is, Apache, IIS, etc.)

<https://docs.microsoft.com/en-us/azure/application-gateway/waf-overview> NEW QUESTION 413You are designing a live streaming event by using Azure Media Services. The delivery of the video will use HTTP Live Streaming (HLS) to an Azure Content Delivery Network (CDN) streaming endpoint. Viewers of the content may not be a trusted party and you require the highest level of security. You must secure the media delivery by using dynamic encryption.Solution: Use Azure Storage Service Encryption to encrypt all assets with an encryption key and authorization policy. Configure the asset's delivery policy to deliver by using Advanced Encryption Standard (AES).Does the solution meet the goal? A. YesB. No Answer: BExplanation:You can use Azure Media Services to secure your media from the time it leaves your computer through storage, processing, and delivery. With Media Services, you can deliver your live and on-demand content encrypted dynamically with Advanced Encryption Standard (AES-128) or any of the three major digital rights management (DRM) systems: Microsoft PlayReady, Google Widevine, and Apple FairPlay.

<https://docs.microsoft.com/en-us/azure/media-services/previous/media-services-content-protection-overview> NEW QUESTION 414A company deploys Azure Active Directory (Azure AD) Connect to synchronize identity information from their on-premises Active Directory Domain Services (AD DS) directory to their Azure AD tenant. The identity information that is

synchronized includes user accounts, credential hashes for authentication (password sync), and group memberships. The company plans to deploy several Windows and Linux virtual machines (VMs) to support their applications. The VMs have the following requirements:- Support domain join, LDAP read, LDAP bind, NTLM and Kerberos authentication, and Group Policy.- Allow users to sign in to the domain using their corporate credentials and connect remotely to the VM by using Remote Desktop. You need to support the VM deployment. Which service should you use? A. Active Directory Federation Services (AS FS) B. Azure AD Privileged Identity Management C. Azure AD Domain Services D. Azure AD Managed Service Identity Answer: C Explanation: Azure AD Domain Services provides managed domain services such as domain join, group policy, LDAP, Kerberos/NTLM authentication that are fully compatible with Windows Server Active Directory. Azure AD Domain Services enables users to sign in to the domain using their corporate credentials - for example, when connecting remotely to machines joined to the domain via Remote Desktop. <https://docs.microsoft.com/en-us/azure/active-directory-domain-services/active-directory-ds-overview> NEW QUESTION 415..... Download the newest PassLeader 70-535 dumps from passleader.com now! 100% Pass Guarantee! 70-535 PDF dumps & 70-535 VCE dumps: <https://www.passleader.com/70-535.html> (426 Q&As) (New Questions Are 100% Available and Wrong Answers Have Been Corrected!
